<p>This study was conducted under a memorandum of understanding between the Illinois Department of Natural Resources and the Board of Trustees of the University of Illinois. The research was performed by the Illinois Natural History Survey, a division of the Illinois Department of Natural Resources. The project was supported by funds made available through the Federal Aid in Sport Fish Restoration Act and administered by the Illinois Department of Natural Resources. The form and content of this report and the interpretations of the data are the responsibility of the Illinois Natural History Survey and the University of Illinois and not the Fisheries Division of the Illinois Department of Natural Resources.</p>

Table 1. Common and scientific names of fishes appearing in this report of the survey of sport fishing in the Illinois portion of Lake Michigan. Only common names will be used in the following text.

Common Name	Scientific Name
Alewife	<i>Alosa pseudoharengus</i>
Bluegill sunfish	<i>Lepomis macrochirus</i>
Brown trout	<i>Salmo trutta</i>
Chinook salmon	<i>Oncorhynchus tshawytscha</i>
Coho salmon	<i>Oncorhynchus kisutch</i>
Common carp	<i>Cyprinus carpio</i>
Freshwater drum	<i>Aplodinotus grunniens</i>
Gizzard shad	<i>Dorosoma cepedianum</i>
Goldfish	<i>Carassius auratus</i>
Grass carp	<i>Ctenopharyngodon idella</i>
Lake trout	<i>Salvelinus namaycush</i>
Largemouth bass	<i>Micropterus salmoides</i>
Pumpkinseed sunfish	<i>Lepomis gibbosus</i>
Rainbow smelt	<i>Osmerus mordax</i>
Rainbow trout	<i>Oncorhynchus mykiss</i>
Rock bass	<i>Ambloplites rupestris</i>
Round goby	<i>Neogobius melanostomus</i>
Sea lamprey	<i>Petromyzon marinus</i>
Smallmouth bass	<i>Micropterus dolomieu</i>
Yellow perch	<i>Perca flavescens</i>

EXECUTIVE SUMMARY

The purpose of this study was to provide estimates of the non-charter sport fishing effort, harvest and expenditures of anglers fishing the Illinois portion of Lake Michigan. The information provided from this study is important to the management of the sport fisheries in the Illinois waters of Lake Michigan. A contact creel survey was used to collect data concerning the daily effort, harvest and expenditures on randomly selected days over a six month period (4/1 - 9/30). The data were summarized and extrapolated over the six month period to achieve estimates for specific locations as well as for the Illinois waters of the lake. The creel period was stratified by time period (segment = three week blocks) and type of day (weekday vs. weekend/holiday). Also, a March survey was conducted at selected sites along the Lake Michigan shoreline. That survey was stratified in a similar fashion as the main survey except that the segment is one month long instead of three weeks.

Conclusions:

1. 2007 saw a decrease in angler effort (down nearly 17% compared to 2006). Pedestrian and launched boat effort decreased 3% and nearly 18% respectively, and moored boat effort decreased over 40%.
2. The number of yellow perch harvested decreased nearly 8% compared to 2006. The total harvest was 305,600 fish. The average weight and length of yellow perch in the survey increased compared to 2006. Mean length increased to 26.6 cm (10.47 in) and mean weight increased to 263 g (0.58 lb), a 2.3% and 11.5% increase respectively compared to 2006.
3. Coho salmon were the largest portion of the salmonid harvest in the Illinois waters of Lake Michigan and increased nearly 62% compared to 2006. The total harvest was 30,900 fish. The average size coho in 2006 weighed 1,902 g (4.19 lb), and measured 56.9 cm (22.4 in) in length, an increase of 19.0% in weight and 5.0% in length.
4. Chinook salmon harvest decreased nearly 28% compared to 2006 with a harvest of 10,500. The average size chinook were nearly identical compared to 2006 with length remaining 72.3 cm (28.5 in) and weight slightly increasing (9g) to 4,150 g (9.14 lb).
5. The rainbow trout harvest decreased by 15% compared to 2006, with a harvest of 2,400 fish. Rainbow trout length and weight slightly decreased compared to 2006 with length decreasing 0.30% to 67.5 cm (26.6 in) and a decrease in weight of 0.40% to 3,219 g (7.09 lb).
6. The lake trout harvest increased by 52% compared to 2006 to 1,000 fish. The average size of lake trout harvested in 2007 was larger than those fish harvested in 2006 with an increase of 32.2% in weight to 3,074 g (6.77 lb) and an increase in length of 7.3% to 64.9 cm (25.6 in).
7. The brown trout harvest decreased by 43% compared to 2006 to 1,700 fish. Average length increased by 6.5% to 55.7 cm (21.9 in) and average weight increased by 13.2% to 2,261 g (4.98 lb).
8. Total expenditures in 2007 were \$8.3 million, 50% below 2006.
9. Weather data were collected throughout the creel season in 2007.
10. The 2007 March survey saw declines in effort, brown trout harvest and rainbow trout harvest and increases in yellow perch and coho salmon harvest compared to 2006. Total effort was 14,018 angler hours, a 5% decrease compared to 2006. Harvest of brown trout (1,146) and rainbow trout (9) declined 41% for brown trout and 86% for rainbow trout. Coho salmon (484) increased 10% and yellow perch (10,538) increased 136%.

ABSTRACT

A survey of sport fishing in the Illinois portion of Lake Michigan was conducted from April 1 to September 30, 2007. The survey covered all legal sport fishing during that period excluding fishing from chartered boats and smelt fishing. It included angling by pedestrians and fishing from boats. The intent of the survey was to provide reliable estimates of sport fishing activity, sport fish harvest, expenditures for sport fishing, and the quality and distribution of sport fishing. Estimated total fishing effort for pedestrians and boaters was 478,000 angler-hours. Estimated total harvest included 305,600 yellow perch, 1,700 brown trout, 2,400 rainbow trout, 1,000 lake trout, 30,900 coho salmon, and 10,500 chinook salmon. Estimated expenditures for boats, motors, trailers, fishing gear, and automobile gas were over \$8.3 million. The yield value of the sport fishing harvest was approximately \$2.4 million.

One additional special survey was conducted. From March 1 to March 31 an early season survey was conducted at Waukegan Harbor, Montrose Harbor and Calumet Park for pedestrian anglers and Waukegan Harbor and Calumet Park for launched-boat anglers. Anglers from both groups fished a total of 14,000 hours and harvested 10,500 yellow perch, 1,150 brown trout, 9 rainbow trout and 480 coho salmon. Estimated expenditures for boats, motors, trailers, fishing gear, and automobile gas were over \$68,000.

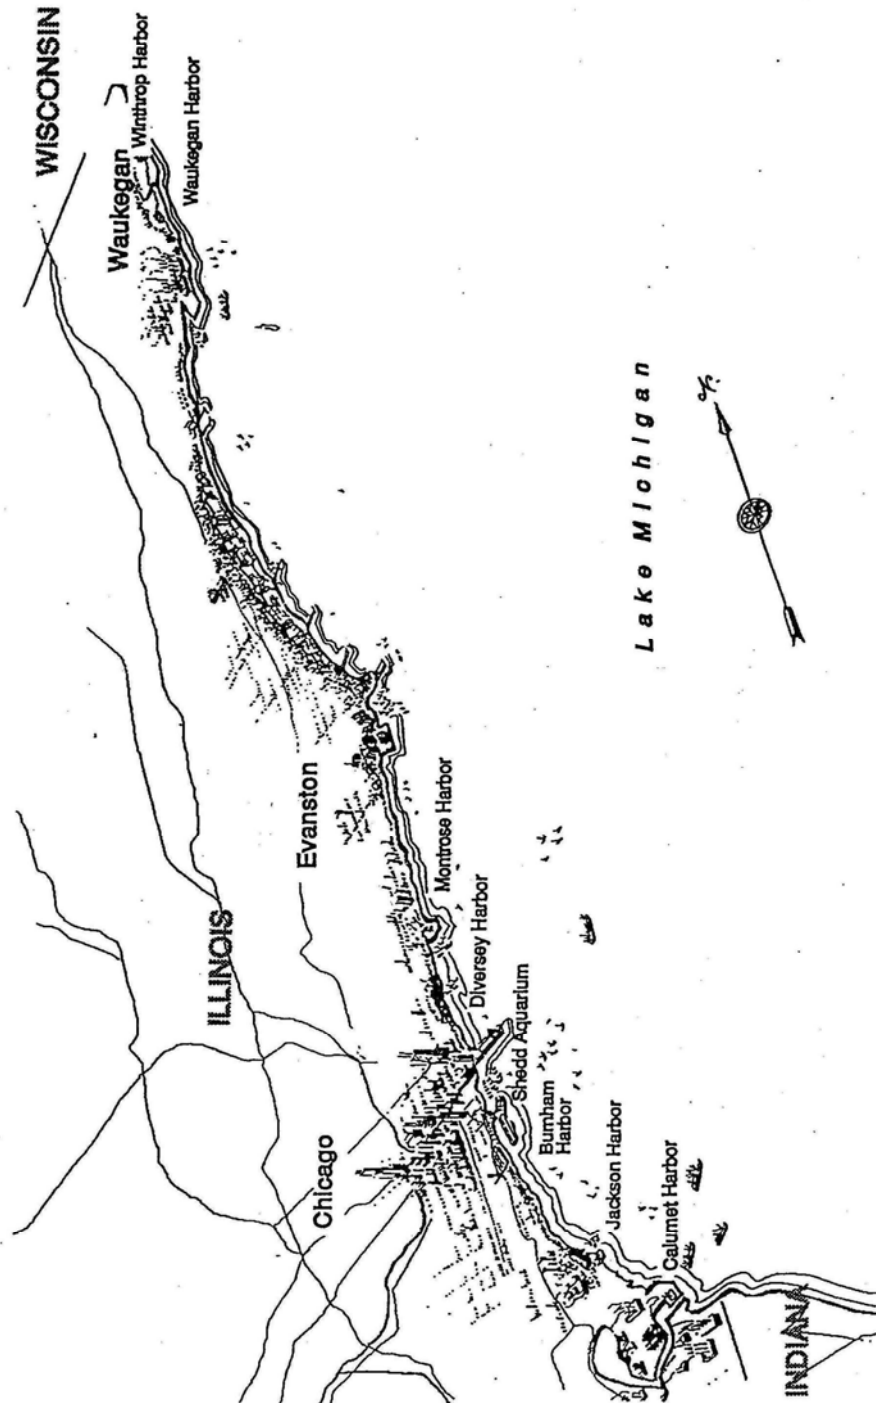

INTRODUCTION

This report summarizes a survey of sport fishing in the Illinois portion of Lake Michigan from April 1 to September 30, 2007. The survey covered all types of legal sport fishing during that period, with the exceptions of charter-boat fishing and smelt fishing. In addition, a supplemental survey of the early spring fishery from March 1 to March 31 was conducted. The intent of the project was to provide reliable estimates of sport fishing activity, sport fish harvest, expenditures for sport fishing, and quality of sport fishing. Biological data concerning length, weight, sea lamprey wounding and scarring and markings (fin clips and external tags) were also collected for individual fish. Results from the first twenty-one years of this series of annual surveys were reported elsewhere and were summarized by Brofka and Czesny (2007). Prior to these reports, the most recent creel survey of this type in Illinois was conducted in 1979 by Muench (Muench 1981).

Geographic setting

The geographic setting of this survey was the 63 mile Illinois shoreline of Lake Michigan (Figure 1). This area is highly developed and heavily industrialized. Chicago covers roughly one-third of the shoreline, and a series of smaller cities cover almost all of the remainder. This section of Lake Michigan lacks significant tributary streams. The slope of the near-shore lake bottom becomes progressively steeper as one moves from south to north, a geographic feature that influences the distribution and success of sport fishing. This progression means that boaters from Chicago must go considerably farther from shore to reach good salmon waters than boaters departing from North Point Marina.

Figure 1. The Illinois shoreline of Lake Michigan.

METHODS

The following groups were considered separately: (1) Pedestrian and launched-boat anglers. These anglers were studied directly through personal interviews and direct head counts conducted between 1 April and 30 September. (2) Anglers using moored boats. The data presented here are based entirely on extrapolations from estimates for anglers using launched boats.

Pedestrians and launched-boat anglers

Estimates of effort and harvest by pedestrian and launched-boat anglers were made for selected primary fishing areas, and those estimates were extrapolated to less heavily fished areas. For each primary fishing area, a modified stratified random sampling design similar to that suggested by Malvestuto (1996) was used. The fishing day was the primary sampling unit. Daily estimates of variables of interest (total harvest by species, expenditures by category, etc.) for each primary site were combined to form seasonal estimates using the formula for stratified random samples given by Cochran (1977).

Use of primary fishing areas

The primary fishing areas for pedestrian anglers were North Point Marina, Waukegan Harbor, Montrose Harbor, Belmont Harbor, Burnham Harbor, McCormick Place, Jackson Park, and Calumet Park. The primary fishing areas for launched boats were North Point Marina, Waukegan Harbor, Diversey Harbor, Burnham Harbor, and Calumet Park. For each day of work, a creel clerk was assigned to visit three areas, two pedestrian areas and one launch area, in a prescribed order. The three areas were always one of four groups: (1) Waukegan Harbor (pedestrians), North Point Marina (pedestrians), North Point Marina (launched boats); (2) Montrose Harbor (pedestrians), Belmont Harbor (pedestrians), Diversey Harbor (launched boats); (3) Burnham Harbor (pedestrians), McCormick Place (pedestrians), Burnham Harbor ramp, (launched boats); and (4) Jackson Park (pedestrians), Calumet Park (pedestrians), Calumet Park (launched boats). The launch ramps at Waukegan Harbor were added in 2006 and were surveyed in the same manner as the launch ramp sites in the four groups. Estimates obtained for the primary fishing areas were extrapolated to all other areas based on the distribution of pedestrian anglers and boat trailers. These distributions were obtained by helicopter flights that were conducted on four weekends during the spring and summer. During each flight, pedestrian anglers were counted and recorded on a form divided by site and the type of pedestrian site: structure (piers and breakwalls), shore (shoreline) and harbor (inside enclosed harbors). Pedestrian anglers who were not at a recognized site were counted and listed in the vicinity of the closest recognized site; the sum of these became the total for "other areas" on the form. Boat trailers with a vehicle attached were counted in the parking lots of launch ramps and were listed on the form at the appropriate site. All of the data collected were combined for the season and averaged, and converted to percentages (Table 2).

Distribution of fishing

Pedestrians and launched boats

The survey recognized 26 fishing areas (Table 2). Helicopter flights in 1985-90 and 1992-2007 were used to determine the distribution of fishing. In 2007 the 26 areas accounted for 98.8% of the pedestrian anglers observed in the aerial surveys and 100% of the boat trailers parked near launch areas. Boats launched from the Calumet Yacht Club (25 to 50 launches per week in mid summer) were not included in this survey. In this survey, interviews were conducted at eight pedestrian fishing areas and five launch areas. The pedestrian areas (North Point Marina, Waukegan Harbor, Montrose Harbor, Belmont Harbor, Burnham Harbor, McCormick Place, Jackson Park, and Calumet Park) accounted for 89.9% of the pedestrian anglers observed during the helicopter flights. The five launch areas (North Point Marina, Waukegan Harbor, Diversey Harbor, Burnham Harbor, and Calumet Park) accounted for 87.7% of the boat trailers observed near launch areas.

Table 2. Distribution of pedestrian anglers and boat trailers along the Illinois shoreline of Lake Michigan, determined by helicopter flights in 2007.

Area	Pedestrian anglers (%)	Boat trailers (%)
1. IL Beach State Park & North Point Marina	1.7	33.0

26. Calumet Park	0.0	8.6
27. other areas	1.2	0.0

Moored boats

The principal boat mooring areas are North Point Marina, Waukegan Harbor, Great Lakes Naval Training Station, Wilmette Harbor, and the Chicago Park District harbors. This survey did not include boats kept at moorings or on land (lift service) in the Calumet or Chicago river systems. We used the number of power boats kept at moorings as an index of fishing activity from moored non-charter power boats (Table 3). Although some fishing occurs from sail boats, we assumed that it was a negligible portion of all fishing. Both private lift services, referred to as I/O service in Table 3, were included in the survey (Larsen Marine, at Waukegan Harbor and Skipper Bud's at North Point Marina).

Table 3. Mooring locations along the Illinois shoreline of Lake Michigan and numbers of non-charter power boats moored at each location, as determined by the marinas and port authorities. Total number of power boats per port in bold.

<u>Mooring area</u>	<u>Number of power boats</u>
North Point Marina	1,143
Public Moorings	1,073
Skipper Bud's I/O service	70
Waukegan Harbor	694
Public Moorings	574
Larsen Marine I/O service	120
Great Lakes Naval Training Station	30
Wilmette Harbor	65
Chicago Park District	3,201
Diversey	600
Burnham	794
other harbor moorings	1,817

Early spring survey

Only two site groups were surveyed in March. The Lake County group consisted of Waukegan Harbor (pedestrians) and Waukegan Harbor (launched boats). The Chicago group consisted of Montrose Harbor (pedestrians), Calumet Park (pedestrians), and Calumet Park (launched boats). These sites included virtually all the open boat ramps and the areas of heaviest concentrations of open water pedestrian anglers this early in the season (based on personal observations and previous surveys). No attempt was made to estimate moored boat effort, harvest or expenditures in the March survey because very few boats are at moorings at that time.

Selection of dates in a stratified random sample

The core fishing season (1 April through 30 September 2007) was stratified by segment and type of day. Each date fell within one segment and was either a week day (non holiday Monday through Friday) or a weekend day (weekends and holidays). The following 18 strata were formed:

- | | |
|---------------------------|------------------------------|
| 1. week days 4/1 - 4/15 | 2. weekend days 4/1 - 4/15 |
| 3. week days 4/16 - 5/6 | 4. weekend days 4/16 - 5/6 |
| 5. week days 5/7 - 5/27 | 6. weekend days 5/7 - 5/27 |
| 7. week days 5/28- 6/17 | 8. weekend days 5/28- 6/17 |
| 9. week days 6/18 - 7/8 | 10. weekend days 6/18 - 7/8 |
| 11. week days 7/9 - 7/29 | 12. weekend days 7/9 - 7/29 |
| 13. week days 7/30 - 8/19 | 14. weekend days 7/30 - 8/19 |
| 15. week days 8/20 - 9/9 | 16. weekend days 8/20 - 9/9 |
| 17. week days 9/10 - 9/30 | 18. weekend days 9/10 - 9/30 |

Within each stratum, dates were selected at random with the restriction that all four groups of sites were sampled each week day (Monday through Friday) and each weekend. This sampling process was conducted separately for each of the four groups of three areas. Three dates were selected from each stratum except 1, 2, 17 and 18; in those strata, which were several days shorter than the others, fewer than three dates were selected for each group of areas. All three areas in each group were visited on the dates selected for that group.

The early spring survey (1 March through March 31) was treated in a similar fashion to the core survey except that the segment was one month.

- | | |
|-------------------------|----------------------------|
| 1. week days 3/1 - 3/31 | 2. weekend days 3/1 - 3/31 |
|-------------------------|----------------------------|

Data collection

Data collection at pedestrian fishing areas consisted of counting all pedestrian anglers at the start and finish of a two-hour interview period and interviewing a representative sample of anglers during the two hours. At the eight primary pedestrian areas the interview period was always 0600 to 0800 or 0830 to 1030. Each interview was designed for one angling party (i.e., one or more anglers fishing together) rather than for one individual angler. By interviewing parties instead of all individuals in a party more interviews can be conducted in a given time frame, redundant information can be avoided, and annoyance to the party is minimized. At launch ramps, all trailers with vehicles attached (except personal watercraft trailers) were counted in the parking lot at the beginning and end of the sampling period (between 1100 and 1300) and a representative sample of all returning fishing parties was interviewed.

The interviewers (referred to as creel clerks) gathered information related to effort (number of angler-hours, number of angler-trips), expenditures for the present fishing trip (by category: major = boat, motor, or trailer; minor = fishing gear; other = auto gas @ 10 cents per mile), species sought, and harvest (by species). Clerks also weighed and measured fish in possession of the anglers, noted clipped fins, and noted sea lamprey wounds and scars. The data form (Figure A1) and instructions to creel clerks are reproduced in Appendix A.

Variables measured for each date

The data collected in the interviews on one date at one area were reduced to a set of variables describing daily fishing activity: (1) Harvest per angler-hour was determined for each species as the number of fish harvested by all parties interviewed divided by the number of hours of fishing by individuals in those parties. (2) Expenditures per angler-trip were determined in each of three categories (major, minor, and other). For all expenditures, total expenditures by all anglers interviewed were divided by the number of anglers interviewed. (3) Angler-hours (i.e., total time spent fishing by all anglers) and (4) angler-trips (i.e., total number of anglers who fished) were determined differently for pedestrians and boaters. For pedestrians, angler-hours was the average number of anglers (at start and finish of interviews) multiplied by the number of hours in the day (from 0.75 hour before sunrise to 0.75 hour after sunset), and angler-trips was angler-hours divided by the average duration of a pedestrian fishing trip (3.56 hours for all interviews with conventional pedestrian anglers from 1998 - 2007 surveys). The number of fishing boats launched for the day was estimated by multiplying the number of fishing boats landing during the two-hour interview period by the estimated average ratio of the number of all boats returning in a day to the number returning between 11:00 and 13:00. That ratio was estimated to be 2.73 by monitoring all boat traffic at North Point Marina on 7 days in 2007. Angler-trips were then estimated as the total number of boats launched for the day multiplied by the average number of anglers per boat (2.38, based on data from 1998 - 2007). Angler-hours were taken as angler-trips multiplied by the yearly average number of hours per angling trip by boaters (5.10, based on data from 1998 - 2007). (5) Harvest was determined for each species as harvest per angler-hour multiplied by angler-hours, and (6) expenditures were determined for each category as expenditures per angler-trip multiplied by angler-trips.

Expansion of daily estimates

The formula given by Cochran (1977) for stratified random samples was employed to expand the daily estimates to form seasonal area-specific estimates of effort, harvest, and expenditures.

Seasonal averages of harvest per angler-hour were obtained for each primary fishing area by taking unweighted averages of daily values. In these calculations, seasonal averages for yellow perch included only data from anglers who were fishing for perch, and seasonal averages for salmonids included only data from anglers who were fishing for salmonids. Anglers who did not specify what they were fishing for were excluded from these calculations.

Extrapolation to other areas

Extrapolations of seasonal estimates from primary fishing areas to other areas were based on the distributions of pedestrian anglers and boat trailers (Table 2). The distribution of boat trailers was assumed to reflect the distribution of launched-boat anglers. In the extrapolations, harvest, effort, and expenditures at areas not visited were estimated by extension of estimates for the nearest primary fishing areas. Thus, for pedestrian anglers, estimates for Waukegan Harbor were extended to all other areas (except North Point Marina) north of and including Wilmette Harbor; estimates for Montrose Harbor were extended to all remaining areas north of Belmont Harbor;

estimates for Belmont Harbor were extended to all remaining areas north of the Monroe Street breakwalls; estimates for Burnham Harbor were extended to all remaining areas north of McCormick Place; estimates for McCormick Place were extended to all remaining areas north of 31st Street; estimates from Jackson Park were extended to all remaining areas north of Rainbow Park; and estimates from Calumet Park were extended to all remaining areas south of (and including) Rainbow Park. For launched boats, estimates for Waukegan Harbor were extended to all launch ramps north of Wilmette (including the "other" areas listed in Table 2); estimates for Diversey were extended to Dawes Park; and results for Calumet Park were extended to the ramp at Jackson Park.

Moored boats

Estimates of effort, harvest, and expenditures by anglers using moored boats were extrapolated from calculations for launched boats. First, the ratios of moored fishing boats to launched fishing boats for North Point Marina, Diversey Harbor, and Burnham Harbor were estimated. On eight dates during the spring and summer of 2007 counts were made of the numbers of fishing boats returning to moorings while simultaneous counts were made of the number of fishing boats returning to the launch ramp. Charter boats were excluded from the counts. The ratio of moored to launched boats was 0.68 in North Point Marina, 0.29 in Diversey Harbor, and 0.60 in Burnham Harbor. Using these figures, seasonal estimates of effort, harvest, and expenditures by anglers using launched boats at North Point, Diversey, and Burnham harbors were extrapolated to moored boats. Thus, for example, the moored boat harvest at North Point Marina for a given segment was estimated to be the launched boat harvest for that segment multiplied by 0.68. Values so derived for North Point, Diversey, and Burnham harbors were then extrapolated to other moored boats based on the distribution of moored power boats (Table 3). Estimates for North Point Marina were extrapolated to boats moored in Waukegan Harbor, Wilmette Harbor, and Great Lakes Naval Training Station, and the combined estimates for Diversey Harbor and Burnham Harbor were extrapolated to all other boats moored in Chicago.

Changes in creel survey methods

Creel survey methods have varied during the past twenty-one years of the creel survey, so comparisons should be made with caution, especially where estimates for anglers using moored boats are concerned.

The most important changes in the methods of collecting and analyzing data since 1998 are as follows: (1) Several parameters used in deriving estimates are themselves estimated. The estimated values were updated during those ten years. Table 4 lists the values of these parameters used each year. (2) The inputs to the formulae for extrapolating harvest, effort, and expenditures by anglers using launched boats to estimate harvest, effort and expenditures for anglers using moored boats varied in the past ten years. This modification of inputs occurred because the estimated ratios of moored boat traffic to launched boat traffic for North Point Marina, Diversey Harbor and Burnham Harbor changed greatly among, 1998 – 2000 and 2003 - 2007 (Table 4) as new data became available. (3) Changes in the average length of pedestrian and boat angler trips and the average number of anglers per boat each year were modified, based on data collected from 1998 through 2007 (Table 5).

Table 4. Parameters used in deriving estimates. Parameter values given for each year are estimated from all available data from the ten previous years.

Parameter	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007
Duration of fishing trip (hours)										
summer pedestrians	3.63	3.62	3.61	3.64	3.64	3.66	3.65	3.62	3.63	3.65
launched boats	5.02	5.03	5.01	5.02	5.00	5.00	5.01	5.03	5.08	5.10
Number of anglers per launched boat	2.57	2.57	2.56	2.55	2.52	2.52	2.41	2.41	2.38	2.38
Ratio of number of launched boats returning in a day to the number returning during 1100 to 1300.	3.39	2.77	3.19	3.19	3.19	3.09	2.95	2.88	2.88	2.73
Ratio of number of moored boats used for fishing on any day to number of launched boats used for fishing.										
North Point Marina	0.85	0.65	0.78	0.78	0.78	0.90	0.71	0.73	0.76	0.68
Diversey Harbor	4.00	2.67	1.80	1.80	1.80	1.73	3.50	0.87	1.13	0.29
Burnham Harbor	1.40	0.43	0.47	0.47	0.47	0.40	0.33	1.67	0.75	0.60
Distributions of pedestrian anglers, launched boats, and moored boats (Tables 1 and 2).	Differences between years were slight.									

Table 5. Average angler trip lengths and number of anglers per boat, 1998- 2007

Year	Pedestrian angler trip length (hours)	Boat angler trip length (hours)	Anglers per boat
1998	3.36	5.19	2.49
1999	3.44	5.19	2.49
2000	3.56	4.75	2.47
2001	4.01	5.12	2.46
2002	3.76	4.66	2.16
2003	3.87	5.01	2.46
2004	3.55	5.27	2.04
2005	3.79	5.34	2.48
2006	3.56	5.48	2.38
2007	3.56	5.01	2.34
Mean \pm 1SD	3.65 \pm 0.20	5.10 \pm 0.25	2.38 \pm 0.16

Confidence intervals and bias

Estimates of harvest, effort, and expenditures are presented without confidence intervals. Confidence intervals presented without estimates of bias are meaningful only if bias is assumed to be negligible, an assumption that we are not willing to make. Although we have collected and will continue to collect data with which to partially assess biases, we are presently unable to make such assessments. Table 4 lists the parameters used in our estimation procedures. Those parameters, to the extent that they are incorrect, introduce bias into the estimation process. Other sources of bias in this survey include the assumption that fishing effort and harvest rates during the times of our interview sets (0600 to 0800 or 0830 to 1030 for pedestrians; 1100 to 1300 for launched boat anglers) are, on average, representative of the entire day.

Yield values

Here the term yield value means the hypothetical market price of the sport fish harvest. For salmonids, approximate market prices of whole fish, headed and gutted were used. For yellow perch, market prices of fillets were used. The estimated harvest for each species was multiplied by the average individual weight of fish weighed in our survey. That estimated harvested round weight was then multiplied by a factor to estimate the harvested market weight. For salmonids, the factor was 0.75 because approximately 25% of the weight of a salmonid is in the head and viscera. For yellow perch the factor was 0.40 because approximately 60% of the fish is wasted in the filleting process. Total harvested marketable weight was then multiplied by approximate market prices (prices observed on the Internet by W.A. Brofka).

Missing data

On some dates creel clerks were unable to complete their assigned interviews. When data were missing from some but not all of the assigned dates in a stratum, estimates for the stratum were based only on data from the completed dates. In these cases, the sample size was smaller than for strata where all interview sets were completed and the estimates were not as precise as estimates derived from full data sets.

Alternate sites/ altered sites

Sometimes, because of unforeseen circumstances (i.e. construction) a primary site may be closed or less accessible during part or all of a sampling season. The fishing pier at North Point Marina wasn't put in place until the first half of May.

Weather

Weather data were collected during the course of the creel survey using a combination of on-site observations at the Lake Michigan Biological Station (LMBS) and the daily Lake Michigan forecasts and observations broadcast by the National Weather Service for Illinois and Indiana waters. Variables recorded each day were: wind speed, wind direction, wave height, air temperature, percent of cloud cover and precipitation. In the analysis each variable was subjectively assigned a point value based on expected effect (based on personal observation and experience) on angler effort, and a composite score was produced for each day (Table 6). The possible range of scores was from 7 to 29 with higher scores reflecting better weather.

Table 6. Weather variables and possible scores used in determining the mean daily weather conditions by three week segment in 2007.

<u>Wind speed</u>		<u>Wave height</u>		<u>Air temperature</u>		<u>Precipitation</u>	
Knots	Points	Feet	Points	Degrees F	Points		Points
0 - 15	5	0 - 2	5	below 20	1	Yes	0
10 - 20	4	1 - 3	4	20 - 39	2	No	5
15 - 25	3	2 - 4	3	40 - 59	3		
20 - 30	2	3 - 5	2	60 - 80	4		
30+	1	5+	1	80+	3		

<u>Wind direction</u>		<u>Cloud cover</u>		<u>Composite</u>	
Direction	Points		Points	Scores	Ratings
N	1	Cloudy	3	26 - 29	Perfect to nearly perfect
NE	1	Clear	5	23 - 25	Good
E	1			20 - 22	Fair
SE	2			17 - 19	Mediocre
S	2			11 - 16	Poor
SW	4			7 - 10	Atrocious
W	4				
NW	3				

(If wind speed is under 10 - 20, score is always 5 for wind direction)

Note: This rating system gauges the effect of weather on angler effort, not angler success. Sometimes outstanding angler success occurs under inclement weather conditions. However, inclement weather conditions generally cause angler effort to be light.

RESULTS

All estimates derived in this survey are given here without qualification; for simplicity of expression, the word "approximately" is not repeated with each estimated value. Estimates are rounded in the following paragraphs.

Total fishing effort in the Illinois portion of Lake Michigan during the study period was 477,700 angler-hours. Anglers harvested 305,600 yellow perch, 30,900 coho salmon, 10,500 chinook salmon, 2,400 rainbow trout, 1,700 brown trout and 1,000 lake trout. Expenditures for boats, motors, trailers, fishing gear, and automobile gas used on Lake Michigan fishing trips during the study period were over \$8.3 million. The yield value of the Illinois sport fishing harvest was nearly \$2.4 million.

Detailed results for 2007 are presented in Tables 7 - 18. Table 7 summarizes all expenditure and angler trip estimates for April - September, 2007. Table 8 summarizes all expenditure and angler trip estimates for March, 2007. Tables 9 and 10 list seasonal harvest and effort (angler hours) estimates for anglers. Tables 11 and 12 present effort and harvest for each segment. Tables 13 and 14 present harvest rates for pedestrians and launched boaters for each segment. Table 15 provides yield values. Table 16 presents average weights of the six most important species, with separate average weights given for the harvest of boaters and pedestrians. Table 17 lists fin clip abbreviations; fin clips observed by our creel clerks are listed in Table 18, with the number of occurrences of each clip or clip combination listed by species, season and angler type. Table 18 can assist in determining the contributions of different stockings of fish to the sport fishery in the Illinois portion of Lake Michigan.

Tables 4 and 5 and 19 - 22 describe comparisons of the 2007 data with data from previous years. Tables 4 and 5 describe parameters used in deriving estimates concerning length of fishing trips, anglers per boat, ratios of moored to launched fishing boats and the ratio of fishing boats returning during 1100 to 1300 compared to the rest of the day. Tables 19 and 20 report angler trips and expenditures among angler types and among years. Tables 21 and 22 compare angler hours and harvest by fish species between angler types and for each year.

Pedestrian fishing

From April 1 - September 30, 2007, pedestrian anglers made over 75,000 trips to Lake Michigan (Table 7) and spent over 264,000 hours fishing (Table 9). Yellow perch was the predominant species in the harvest, with a harvest of over 264,000 fish (Table 9). Chinook salmon were the next most important species for pedestrian anglers, with a harvest of over 2,500 (Table 9). Pedestrian anglers spent \$653,000 (\$8.62 per trip) for fishing gear and \$134,000 (\$1.77 per trip) for automobile gas (Table 7).

Fishing by boaters using launched boats

Anglers who used launched boats made over 25,000 trips to Lake Michigan (Table 7) and spent over 126,000 hours fishing (Table 9). The most abundant species in their harvest were yellow perch (45,800), coho salmon (16,900), chinook salmon (4,500), rainbow trout (1,200), and lake trout (550) (Table 9). For salmonids, Waukegan launch ramp was the most productive of the five primary launch areas, accounting for 45% of the lake trout, rainbow trout, chinook salmon, and coho salmon taken by anglers who used launched boats (Table 9). Waukegan launch ramp accounted for 48% of the yellow perch harvested by launched boat anglers (Table 9). Expenditures by anglers using launched boats were \$3,679,000 (\$167 per trip), with nearly 90% of that amount going for boats, motors, and trailers (Table 7).

Fishing by boaters using moored boats

Our estimates for boaters using boats kept at moorings were derived by extrapolation from estimates for boaters using launched boats. This group of anglers harvested 30,300 yellow perch, 13,500 coho salmon, 3,400 chinook salmon, 900 rainbow trout, and 400 lake trout (Table 9), and spent nearly \$3.5 million for boats, motors, trailers, fishing gear, and automobile gas (Table 7). Mooring costs were excluded.

Yield values

The estimated yield values of the three most commonly harvested sport species were \$1,063,000 for yellow perch, \$610,000 for chinook salmon, and \$567,000 for coho salmon (Table 15). Currently, none of the species listed in Table 15 are commercially available from Lake Michigan except yellow perch from the Wisconsin portion of Green Bay. The values of all species are derived from the retail prices of those species commercially harvested or raised in other waters.

Comparisons with preceding years

Total angler fishing effort in 2007 decreased by 16.6% compared to 2006 (Table 21). Pedestrian effort decreased by 3.0%, launched boat effort decreased by 17.8% and moored boat effort decreased by 40.6% compared to 2006 (Table 21 and Figure 2). Angler success for salmonids (number of fish per angler hour) increased for boat anglers but fell for pedestrian anglers compared to 2006 (Figure 3a). Angler success for yellow perch decreased for boat but increased for pedestrian anglers compared to 2006 (Figure 3b). Directed angler effort for salmonids increased for both pedestrian and boat anglers compared to 2006 (Figure 4a) and directed angler effort for yellow perch decreased for both pedestrian and boat anglers compared to 2006 (Figure 4b).

Biomass of both yellow perch and salmonids harvested increased, compared to 2006 (Figure 5).

The yellow perch harvest of 305,572 represented a decrease of 7.9% compared to the 2006 harvest (Table 21 and Figure 6). The average weight of yellow perch kept by anglers increased to 263g (0.58 lb.) (Table 15). The average length increased to 266 mm (Figures 7 and 8). Perch fishing was excellent for Waukegan boat anglers in the spring, good in June, closed in July, and fair after the closure (Tables 11 and 12, Figure 9).

The 2007 harvest of coho salmon increased by 61.9% compared to 2006 (Table 21 and Figure 10). Weight 1,902 g (4.19 lb.) of creel coho salmon increased 18.9% and length (569 mm) increased 5.0% compared 2006 (Table 15, Figures 11 and 12). 78% of the harvest occurred from early May through mid June (Tables 11 and 12, Figure 13).

The chinook salmon harvest decreased to 10,474 fish for 2007 (Table 21 and Figure 14). Average length was 723 mm, the same as 2006 and the average weight was virtually the same at 4,150 g (9.14 lb.), (Table 15, and Figures 15 and 16). Chinook salmon harvest distribution was similar to the twenty-one year mean with 71% of the harvest occurring in the last three segments (late July through September) of the survey (Tables 11 and 12, Figure 17).

The 2007 harvest of lake trout was 993, an increase of 52.1% compared to 2006, (Table 21 and Figure 18). The average weight increased by 32.2% and the average length increased by 6.7% compared to 2006 (Table 15, Figures 19 and 20). Eighty-nine percent of the harvest was distributed between segments 5 through 7 (June 17 – August 19) (Tables 11 and 12, Figure 21).

The 2007 brown trout harvest (1,720) decreased 43.3% compared to 2006 (Table 21, Figure 22). The average length (557 mm) increased by 6.5% compared to 2006 and the average weight of 2,260 g (4.98 lb.) decreased by 16% (Table 15 and Figures 23 and 24). The peak of the harvest occurred three weeks later than the twenty-one year mean (Tables 11 and 12, Figure 25).

The 2007 rainbow trout harvest (2,375) decreased by 15% compared to 2006 (Table 21 and Figure 26). The average length (675mm) and weight 3,219 g (7.09 lb.) of creeled rainbow trout were virtually unchanged compared to 2006 (Table 15 and Figures 27 and 28). Nearly 83% of harvest occurred during segments 3 through 7 (May 7-August 19), (Tables 11 and 12, Figure 29).

Estimated expenditures for boats, motors, and trailers decreased by 46.8% compared to 2006 (Table 19). Minor expenditures decreased by 67.0% and other expenditures decreased by 26.0%.

Weather data were collected throughout the creel season in 2007. The weather was generally better than 2006, especially during the weekends. The last six weeks saw very good weather in general which may have boosted launched boat effort (Figures 30 and 31). As in previous years, fish availability had more effect than weather for pedestrian anglers (Figure 32). Salmon and trout being close to shore early and late in the sampling period and the closing and opening of yellow perch season seem to drive pedestrian effort more than weather. Ongoing collection of weather data during the creel survey will permit evaluation of how significantly weather affects fishing in relation to other factors.

Minor species

In addition to the species for which results are presented in detail in Tables 9 - 22, creel clerks reported several other species of fish in possession of anglers. For some species, an estimate has been made of the total number of fish harvested and numbers caught (numbers in parentheses). For other species, because so few fish were observed just the actual number observed is reported. Most of the minor species were harvested in or near the harbors. **Rock bass**, 10,650 (32,595); **bluegill sunfish**, 269 (1,994), **pumpkinseed sunfish**, 20 (82); (Figure 33); **common carp**, 154 (406); **freshwater drum**, 1,965 (2,676) (Figure 34); **smallmouth bass**, 252 (10,207); **largemouth bass**, 49(1,405) (Figure 35); **gizzard shad**, 1 fish observed; **goldfish**, 4 fish observed; **grass carp**, 1 fish observed; anglers also harvested **alewives** for use as bait and caught **round gobies** (some were retained for food, most were not retained). **Round gobies** were observed being caught by anglers at all of our pedestrian sites.

The 2007 early spring survey saw increases in coho salmon and yellow perch harvest and decreases in angler effort, brown trout harvest and rainbow trout harvest compared to 2006. Angler effort decreased 5% compared to 2006. Harvest of salmonids decreased 41.1% for brown trout, 86.1% for rainbow trout but increased 9.8% for coho salmon. A yellow perch harvest of 10,538 fish was 136% above the 2006 harvest. Most of these fish were caught by boat anglers in the Calumet River (Table 22).

DISCUSSION

Changes in the fishery and the creel survey in 2007

The data entry and analysis of the data was completely overhauled switching from a DOS based RBase database to Windows based Access in 2007. Additional tweaking of the database and analysis tools occurred and the 2006 totals have been amended.

Angler effort

Total angler fishing effort in 2007 decreased for all angler modes compared to 2006. Effort decreased 17.8% for launched boats, 3.0% for pedestrians and 40.6% for moored boats.

Yellow perch

Annual yellow perch harvests in Illinois were well over one million fish each year from 1986 through 1993 with the exception of 1989. Beginning in 1994 however, harvest fell to under 600,000 and by 1997 fell to well under 60,000. The 2001 increased harvest reached 166,510 due to the combination of the repeal of the slot limit and moving the month closure to July. The 2002 harvest increased slightly to 169,233. The 2003 harvest increased again slightly to 174,200 though harvest per unit effort fell compared to 2002. 2004 saw a strong increase in harvest to 221,923. 2005 saw another strong increase in harvest to 301,085. Harvest increased again in 2006 to 331,728. 2007 saw a decrease of 7.9% in perch harvest (305,572) with an increase of 10.3% occurring in the pedestrian fishery but a 38% decrease in the boat fishery. Overall effort directed at yellow perch decreased 14.4% but HPE (harvest per angler effort expressed in fish per angler hour) increased 8.4% to 1.68 yellow perch per angler hour. Analysis of yellow perch aged caught by anglers show that the fishery is still supported by two year classes, 2002 and 2003, with the 2002 year class dominating the harvest (Rebecca Redman, INHS, personal communication).

Coho salmon

Coho salmon have been the main component of both the boat and pedestrian salmonid fishery. In the boat fishery, coho salmon make up 60 to 70% of the salmonids harvested in a typical year. 2007 was another typical year with coho salmon accounting for 66.5% of salmonids harvested by the non-charter fishery. The 2007 harvest of nearly 30,900 coho salmon was a 61.9% increase compared to 2006. Mean weight of harvested coho salmon during 2007 was 1,900 g which was 27% heavier than the twenty-two year mean.

Other salmonids

Coho salmon harvest has traditionally been concentrated in the spring and early to mid-summer. Other salmonids, especially lake trout and chinook salmon, make up the majority of the harvest from mid-summer through the fall. The lake trout harvest was stable from 1991 through 1997 with the exception of 1996. The lake trout harvest in 1998 was exceptional, the highest that this survey has ever seen. 1999 and 2000 saw harvest return to the low level recorded in 1996. The 2001 harvest was very close to the twenty year mean but in 2002 through 2005 returned to the levels seen in 1999 and 2000. The harvest in 2006 (653) was the lowest ever observed by this survey. The 2007 harvest saw an increase of 52.1% (993).

The chinook fishery before 1988 was the mainstay of the summer/fall salmonid fishery. Chinook salmon are highly prized because they can attain a very large size and are extremely powerful fighters. Bacterial kidney disease (BKD) was blamed for die offs of chinook salmon beginning in 1988. Since 1987, the mean harvest of chinook salmon has been around 10,000 fish. The harvest bottomed out in 1994 with 2,900 chinook taken. Chinook salmon are now closely monitored in the hatchery and in the wild for BKD (Clark, 1996). 2007 saw a decrease in harvest of nearly 28% compared to 2006, to nearly 10,500 fish. Mean weight increased slightly to 4,150 g (9.14 lbs) compared to 2006.

Brown trout are an important component of the spring salmonid fishery with an average harvest of 4,100 fish annually. Pedestrian angling normally accounts for 70% of those fish. The 2007 harvest of 1,700 browns was a decrease of 43% from the 2006 harvest. The mean weight increased to 2,260 g (4.98 lbs).

Rainbow trout are a component of the spring and summer fishery. Some mature fish are caught in the spring by pedestrian anglers, but the majority of the fish are caught by the boat fishery. The annual mean harvest has been 5,000. 1998 saw the highest harvest of rainbow trout at 11,500. 2007 saw a decrease of 15% compared to 2006 with a harvest of over 2,400 fish. The mean weight decreased slightly to 3,220g (7.09 lbs) in 2007.

Minor species

Certain species that have been present in the areas surveyed since the survey began have recently grown in prominence. Black bass (smallmouth and largemouth bass) inhabiting the harbors and shoreline of the Illinois portion of Lake Michigan have increasingly been the focus of bass anglers nationwide, as indicated by the national B.A.S.S. tournament based at Burnham Harbor July 19 - 23, 2000. Common carp and freshwater drum are being targeted both by anglers fishing for food and catch and release anglers using European carp tournament fishing techniques.

Panfish other than yellow perch are being targeted or kept incidentally by pedestrian anglers, with rock bass presently being the most numerous; their numbers equal from 1% to nearly 57% of the annual yellow perch harvest in the past ten years. Ten percent of total angling effort was directed at minor species in 2007.

Expenditures

2007 saw decreases in all expenditure categories compared to 2006. Major expenditures (boat, motor and trailers) decreased over 46%. Minor expenditures (tackle, bait, downriggers, etc.) decreased 67% and other expenditures (mileage) decreased 26%.

Early spring (March) survey

The March survey is heavily influenced by the weather in March and the severity of the winter preceding March. In 1995, the first year of the survey, the entire shoreline and harbors were free of ice and no severe lake storms occurred (storms with sustained high winds of an easterly direction generating high seas, damage and erosion to the shoreline). Fishing was good for both coho salmon and brown trout. In 1996 the shoreline and harbors were locked in ice for the first three weeks of March (Brofka and Marsden, 1997). A severe lake storm occurred in the third week. Effort was only 35% of what it had been in 1995 with almost half the effort concentrated at the power plant discharge in Waukegan (Brofka and Marsden, 1997). Harvest of brown trout and coho salmon were much lower than in 1995. In 1997 the shoreline and harbors were free of ice and the shoreline did not suffer from any severe storms. March 1997 saw high harvests of both coho salmon and brown trout; angler effort was four times higher than in 1996. 1998 and 1999 were similar years with a generally mild winter which kept ice formation to a minimum and a powerful storm early (second week). 2000 saw a very mild winter and a relatively calm March. 2003 saw similar conditions as in 1996 with the exception of major lake storms. 2004 was a marked improvement over 2003 with increases in all categories except lake trout and chinook salmon (which remained the same at zero harvested). 2005 saw a decline in all categories. 2006 was similar to 2005. 2007 survey found all of the harbors frozen. Of the last ten years of March surveys, 2007 would rank ninth in effort, first in yellow perch, seventh in brown trout, and tenth in rainbow trout and sixth in coho salmon. The brown trout and rainbow trout harvest would have been higher if the Waukegan power plant discharge and pier had been open to the public as it had been prior to 2004.

ACKNOWLEDGMENTS

We thank Dan Makauskas and Steve Robillard for their coordination, advice and review of this report; Rebecca Redman for supplying yellow perch data; Martha Kneuer for administrative tasks; Zachary Blevins, Robert Jagla, Jeramy Pinkerton and John Taylor for their long hours collecting data; David Glover for overhauling the database and analysis software, and Nan Trudeau for assisting in supervising the survey, collecting and entering data and compiling and analyzing the weather data.

Table 13. Harvest rates by pedestrian anglers of the Illinois portion of Lake Michigan during April - September, 2007. For yellow perch, only data from anglers fishing for yellow perch were used. For the five salmonid species, only data from anglers fishing for salmonids were used. Asterisks represent instances when creel clerks found no anglers fishing for the species in question or that location was closed to fishing. Wau. = Waukegan.

Table 14. Harvest rates by anglers using launched boats of the Illinois portion of Lake Michigan during April - September, 2007. For yellow perch, only data from anglers fishing for yellow perch were used. For the five salmonid species, only data from anglers fishing for salmonids were used. Asterisks represent instances when creel clerks found no anglers fishing for the species in question or that location was closed to fishing.

Time Period	Area	Harvest per angler-hour

Table 15. Yield values of fish harvested by non-charter sport anglers in the Illinois waters of Lake Michigan during April - September 2007. All fish are assumed to be prepared as fillets with 60% waste. Prices for all except brown trout (used rainbow trout value) are those current in national markets in April, 2008.

Species	Total harvest	Av. wt (lbs)	Round wt (lbs)	Market wt (lbs)	Price per pound	Yield value
Yellow perch	305,572	0.58	177,232	70,893	\$15.00	\$1,063,395
Brown trout	1,720	4.98	8,566	3,426	\$9.00	\$30,834
Rainbow trout	2,375	7.09	16,839	6,736	\$9.00	\$60,624
Lake trout	993	6.77	6,723	2,689	\$9.00	\$24,201
Coho salmon	30,883	4.19	129,400	51,760	\$10.95	\$566,772
Chinook salmon	10,474	9.14	95,732	38,293	\$15.95	\$610,773

Combined yield value of all species: \$2,356,599

Table 16. Average weights of fish harvested in the Illinois waters of Lake Michigan during 2007. Weights are in grams. n = number of fish weighed. Seasons are defined by the following dates: early spring = 3/1-3/31, spring = 4/1-5/6, early summer = 5/7-6/17, midsummer = 6/18-7/29, late summer = 7/30-9/9, early fall = 9/10-9/30. Asterisks represent situations where no fish were weighed.

Adipose fin	ad
Dorsal fin	do
Left maxillary bone	lm
Right maxillary bone	rm
Left pectoral fin	lp
Right pectoral fin	rp
Left ventral fin	lv
Right ventral fin	rv

Table 18. Fin clip summary for salmonids harvested by non-charter anglers in the Illinois waters of Lake Michigan during 2007. Seasons are defined by the following dates: early spring = 3/1-3/31, spring = 4/1-5/6, early summer = 5/7-6/17, midsummer = 6/18-7/29, late summer = 7/30-9/9, early fall = 9/10-9/30. Occurrences of clips are shown separately for two types of anglers: boaters (b), and pedestrians (p). Typically, only a portion of the salmonids stocked each year are marked. However, all lake trout stocked are clipped. Lake trout examined by clerks which exhibit no fin clips are one of four possibilities: 1. the lake trout is naturally produced (wild). 2. the lake trout failed to receive a fin clip in the hatchery. 3. the lake trout regenerated the missing fin or fins. 4. the clerk did not examine the lake trout thoroughly enough and missed the clip or clips.

APPENDIX A - DATA FORM AND INSTRUCTIONS TO CLERKS

We record data on the Interview Form and a modified version of the same. The modified version is sometimes used by a helper in connection with interviews of boaters (see "Instructions to Clerks -- Work Assignments").

One important general rule applies to both forms: "Fill in all the blanks". If you don't know a particular value, draw a diagonal slash through that space on the form. The only exception to this rule is the "numbers in possession" section of the Interview Form. In that section, blanks are interpreted as zeros.

Interviews are obtained in sets. For each set, you visit a site and interview a number of angling parties. Each interview involves data for an entire angling party, although you might only speak with one individual angler. The interviews are taken from pedestrian anglers or from boaters returning to a launch ramp.

When pedestrian anglers are being interviewed, interview either all present or all that can be interviewed in the assigned period (usually two hours). Counts of pedestrian anglers are made at the start and finish of the interview set. When all pedestrian fishing parties cannot be interviewed, interview a representative sample of the anglers present. Thus, if the site includes harbor, shore, and structure areas (see maps), you interview parties from all three areas in proportion to their numbers. Approach all types of people (men, women, Chinese, Hispanic, white, polite, surly, etc.) without special favor for or against any. To assure impartiality skip a fixed number of anglers between interviews, with the number to skip determined so that the entire site is covered during the interview period. If you encounter an angling party that has already been interviewed in our creel survey that day, skip them.

When counting anglers, ignore spectators (casual passers-by) but include members of the angling party who are not fishing at the moment. This can include family members (spouses and children over five years old) who are accompanying the angler.

When boaters are interviewed, stay at the ramp for a predetermined time (usually two hours) and record data for all returning boats. Sometimes it is not possible to interview all angling boats. When that happens, you will interview a representative sample of boats containing anglers. When a boat is not interviewed, you record an ID number (see below), the time (under "end time"), and one of four notes (in the right-hand margin): "ANI" (anglers - no interview), "PNA" (power - no anglers), "SAIL" (sail boat), and "CH" (charter fishing boat). Counts of trailers are made at the start and finish of the interview period. It is important that the counts indicate the number of trailers at the times when you start and finish your interview set. Sail boats, non-angling power boats, and charter boats are never interviewed.

Record the total number of trailers of all types, excluding jet ski trailers, but only count empty trailers (those without boats on them) with vehicles attached. Only count trailers at the west ramp area when covering Burnham Harbor.

The interview form has four areas for recording data: 1) Site Data, 2) Party Record, 3) Catch Record, and 4) Fish Record.

1) Site Data. This area is a condensed version of the Instantaneous Counts Form. Counts are recorded at the start and finish of each interview set. Remember the rule: "Fill in all the blanks". When conducting boat interviews, record slashes in the pedestrian spaces. When conducting pedestrian interviews of any kind, enter a slash in the trailers space. When conducting pedestrian interviews with "regular peds", always enter slashes for all three types of "special peds", and vice-versa.

2) Party Record and 3) Catch Record. These areas are filled-in during the interviews. Column headings are explained here:

ID - Interviews (and non-interviewed boats) are sequentially numbered. For pedestrians, assign a number to each pedestrian party interviewed. For boaters, assign a number to each boat that returns to the ramp, including those that are not interviewed. Each clerk assigns one series of numbers each day, with no repeats. Thus, for example, when you conduct more than one interview set in a day, do not begin the second set with number 1; continue numbering where you left off in numbering the previous set.

angler type - One of six mutually exclusive possibilities is circled: har (harbor), sho (shore), str (structure), lau (launched), sna (snagger), and ice (ice-angler).

angers - For each party record the total number of anglers (tot) and the number who are Illinois residents (res). Remember, as in the Instantaneous Counts Form, include members of the angling party who are not fishing at the moment.

lines - For each party record the number of fishing rods (rod) and the number of power lines (pwr) in use by that party. Trolley lines are counted as power lines here.

trip times - Record three times: the time the fishing trip started, the time of the interview, and the time the trip ended (or is expected to end). Always record times in 24-hour time (e.g., two o'clock p.m. is 1400). When the fishing trip has started the previous day, still record the time of day that fishing started. Fishing trips by pedestrians are considered to start when the angling party arrives at the shoreline. Fishing trips using boats are considered to start when the boat leaves the ramp and to end when the boat arrives back at the ramp.

expenses - Three specific items are recorded. Remember, that data you record applies to the entire party interviewed. You record only costs of items acquired since the last fishing trip on Lake Michigan. If this is the first trip that an angler has ever made to Lake Michigan, include the total purchase price of all items in each category, regardless of when purchased. Notice that we are not concerned with when the item was paid for, only with when it was acquired and what it cost. 1) This category applies to launched boat anglers only. For major expenses (**maj**), record the purchase price of boat, motor, and /or trailer, if acquired since the last fishing trip on Lake Michigan. Include newly purchased used equipment. 2) For minor expenses (**min**), record the purchase price of any fishing equipment (rods, reels, downriggers, line, hooks, lures, bait, nets, etc.) purchased since the last fishing trip on Lake Michigan. Include only things directly used in the capture of fish. Do not include electronic equipment, food and drink, and items for the boat. 3) In the column headed "**other**", record the estimated cost of driving to this site. Here we assume a cost of **ten cents per mile**, so you simply record the round trip mileage divided by ten. This should be the total round trip distance **for all cars** used for this trip by members of the fishing party.

sought - Record species sought as p (perch), s (salmonid), ps ("whatever bites"), or o (other specific target species).

numbers in possession - Record only the numbers of fish in possession of the angling party. Fish names are abbreviated as follows: BN - brown trout, RB - rainbow trout, CO - coho salmon, LT - lake trout, CH - chinook salmon, YP - yellow perch, SM - smallmouth bass, RK - rock bass, PK - pumpkinseed sunfish, BG - bluegill sunfish, CP - common carp, FD - freshwater drum, OTHER - any species of fish that does not have a named column. Write the name or names of the other species in the margin next to the interview and a number breakdown if there is more than one other species. Accurate identification is extremely important; don't hesitate to use your key if you have any doubt about the identification of any fish. If the fish in possession of an angling party include some caught at any other site, exclude those from the numbers recorded here.

(# floy tags on yellow perch) - Ask the angler how many floy tags he/she has seen on **yellow perch** presently in possession. Record that number here.

4) Total Catch Record. In 1998 we will also be recording the total catch of anglers, including fish that were released. If when asked, an angler states that he has released some or all of his catch that day, record the number released of each species caught on the line immediately below the original interview for that party. Just record the catch data; do not give this line an id number or include any of the other data from the original interview row. For example, an angler states that he kept his limit of 5 coho but caught and released 4 more. So on the first row you would write down all of the pertinent data needed for a complete interview including 5 in the coho column. On the next row you would just record 4 in the coho column and leave the rest of the row blank. Record your next interview on the following row.

5) Fish Record. Here you record physical measurements made in connection with the interviews. Above this section you record the time your interview set was scheduled to start (usually 0600, 0830, or 1100). You should be able to weigh, measure, and examine for clips (for purposes of this form, we count floy tags under the heading "clips"), scars, and wounds on all salmonids that you encounter in possession of anglers. When an angler has more than 5 yellow

perch, select five fish at random from the catch to weigh, measure, and examine for floy tags (you don't need to look for clipped fins or lamprey marks on yellow perch). In addition to the five randomly selected perch, record data for any other yellow perch on which the angler has found a floy tag. On some occasions anglers will have removed floy tags from fish before you arrive. If it is not possible to know which specific fish the tag came from, record all information printed on the tag in the margin of the form and keep the tag. Column headings are explained here:

ID - Record the same number recorded in "Party Record" for the angling party that caught this fish.

species - Record the two-letter abbreviation of the species name. The abbreviations are those that appear as headings in the "Catch Record" section.

weight - Record the weight of the fish in grams. Do not record weights of gutted or beheaded fish. Be sure to "zero" the scale and to use the appropriate scale for the size of the fish being weighed.

length - Record total length (distance from tip of snout to tip of tail) in centimeters.

clipped fins - As outlined above you will examine all salmonids for clipped fins and floy tags, and you will examine some yellow perch for floy tags only. You record abbreviations for what you find (for purposes of data recording, assume that perch never have clipped fins or lamprey scars or wounds). The permitted entries are do (dorsal), ad (adipose), lp (left pectoral), rp (right pectoral), lv (left ventral), rv (right ventral), fl (floy tag), lm (left maxillary), rm (right maxillary) and none. Also, when you encounter a floy tag, record all the information printed on the tag. Remember, leave no blank spaces on the form; if you are unable to examine the fish, draw diagonal slashes through the spaces.

Remember all stocked lake trout have at least one fin clipped and possibly as many as three. Other salmonids may have none or up to three fins clipped so examine these fish carefully. Some fish are marked with a coded wire tag buried in the snout. These fish (primarily chinook salmon, lake trout and rainbow trout) have the adipose fin removed but no other fins are missing. Ask permission from the angler and collect the head for later tag extraction. Fill out the form included in the head bag and give the angler a copy.

scars and # wounds - This refers to marks left by sea lampreys; we are not interested in scars and wounds from other causes. The distinction is that wounds are still all or partly red, while scars are not. Since yellow perch are not examined for scars and wounds, always draw slashes through these boxes for perch.

APPENDIX B - PROJECT F-52-R22 PERFORMANCE REPORT

The foregoing report does not directly discuss progress toward each of the specific objectives listed in the AFA for this project. The purpose of this appendix is to list the jobs defined in that AFA and to comment on progress toward the objectives of those jobs.

Study 101. Contact creel survey

Job 101.1. Field interviews (core creel).

Objective: To gather fishery data from anglers.

Progress: Completed.

Job 101.2. Field interviews (re-estimation of constants).

Objective: To re-estimate constants used to extrapolate creel data to non-creeled sites, times and fishing modes.

Progress: Completed.

Job 101.3. Data entry

Objective: To enter data into computer files.

Progress: Completed.

Job 101.4. Analysis and reporting

Objective: To produce and summarize estimates of fishing effort and harvest.

Progress: Completed.

REPORT OF EXPENDITURES, 2007 - 2008

		Proposed	Actual
Study 101	Contact creel survey		
Job 101.1	Field interviews (core creel)	\$98,000	\$98,000
Job 101.2	Field interviews (re-estimation of constants)	\$39,000	\$39,000
Job 101.3	Data entry	\$9,965	\$9,965
Job 101.4	Analysis and reporting	\$26,000	\$26,000
Total Cost		\$172,965	\$172,965
Federal share		\$129,724	\$124,724
State share		\$43,241	\$43,241
